

Use-Case Flow Specification

Name: ES Sukruth | SRN: PES1UG24CS160

Lab 1 | Problem Statement #32 — Personal Subscription & Recurring Expense Auditor

Use Case ID	UC-01
Use Case Name	Analyze Subscription Expenses & View Monthly Burn Rate
Primary Actor	Individual User
Secondary Actors	Bank / Transaction Data Source; Finance Auditor
Related Requirements	FR-001, FR-003, NFR-001, NFR-002
Priority	High

Preconditions

- The Individual User has access to the system.
- A transaction file in a supported format (CSV or OFX) is available for import.
- The transaction data source is reachable and the system is operational.

Postconditions

- Recurring billing patterns and relevant renewal dates are identified and recorded.
- A monthly burn-rate summary is displayed with recurring expenditure grouped by service category.

Main Success Scenario

1. The Individual User selects the option to import transaction data and uploads a CSV or OFX file.
2. The system validates the file format and checks that the import can be processed.
3. The system securely parses and stores the transaction data without storing raw banking credentials in cleartext.
4. The system analyzes transaction patterns to identify recurring charges.
5. The system records the identified recurring services, amounts, billing intervals, and renewal dates where available.
6. The system categorizes the identified recurring services and calculates the projected monthly burn rate.
7. The system displays the subscription summary and monthly burn-rate dashboard.
8. The Individual User reviews the identified subscriptions and spending summary. The use case ends successfully.

Alternate Flow — AF-01: Invalid or Unsupported Transaction File

1. At Step 2, if the uploaded file is not a valid CSV/OFX file or cannot be read, the system displays an error message explaining that the file is invalid or unsupported.
2. The system does not process or store the invalid file.
3. The Individual User may upload another file or cancel the operation. If the user cancels, the use case ends without creating a subscription audit.
